OXAZOLIDINONE ANTIBACTERIAL AGENTS HAVING A THIOCARBONYL FUNCTIONALITY

5 BACKGROUND OF THE INVENTION

The present invention relates to new and useful oxazolidinone compounds and their preparations, and more particularly to oxazolidinone compounds in which the carbonyl functionality of -NH-C(O)-R is converted to a thiocarbonyl functionality, such as a thiourea -NH-C(S)-NH₂, an alkyl thiourea -NH-C(S)-NH-(C₁₋₄ alkyl),
10 thioamide -NH-C(S)-(C₁₋₄ alkyl) or -NH-C(S)-H.

Replacement of the oxygen atom with a sulfur atom has unexpectedly improved the antimicrobial properties of the compounds. The compounds are useful antimicrobial agents, effective against a number of human and veterinary pathogens, including Gram-positive aerobic bacteria such as multiply-resistant
15 staphylococci and streptococci, Gram-negative organisms such as *H. influenzae* and *M. catarrhalis* as well as anaerobic organisms such as bacteroides and clostridia species, and acid-fast organisms such as *Mycobacterium tuberculosis* and *Mycobacterium avium*. The compounds are particularly useful because they are effective against the latter organisms which are known to be responsible for
20 infection in persons with AIDS.

It is to be understood that the dosages may vary depending upon the requirements of the patient, the severity of the bacterial infection being treated, and the particular compound being used. Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses for administration, e.g., 2-4 four times per day.

When the compounds according to this invention are administered parenterally, i.e., by injection, for example, by intravenous injection or by other parenteral routes of administration. Pharmaceutical compositions for parenteral administration will generally contain a pharmaceutically acceptable amount of the compound or a soluble salt (acid addition salt or base salt) dissolved in a pharmaceutically acceptable liquid carrier such as, for example, water-for-injection and a buffer to provide a suitably buffered isotonic solution, for example, having a pH of about 3.5-6. Suitable buffering agents include, for example, trisodium orthophosphate, sodium bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine to name but a few representative buffering agents. The compound of this invention generally will be dissolved in the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/mL to about 400 mg/mL of solution. The resulting liquid pharmaceutical composition will be administered so as to obtain the above-mentioned antibacterially effective amount of dosage. The compounds according to this invention are advantageously administered orally in solid and liquid dosage forms.

As a topical treatment an effective amount of Formula I is admixed in a pharmaceutically acceptable gel or cream vehicle that can be applied to the patient's skin at the area of treatment. Preparation of such creams and gels is well known in the art and can include penetration enhancers.

MIC Test Method

The *in vitro* MICs of test compounds were determined by a standard agar dilution method. A stock drug solution of each analog is prepared in the preferred solvent, usually DMSO:H₂O (1:3). Serial 2-fold dilutions of each sample are made

using 1.0 ml aliquots of sterile distilled water. To each 1.0 ml aliquot of drug is added 9 ml of molten Mueller Hinton agar medium. The drug-supplemented agar is mixed, poured into 15 x 100 mm petri dishes, and allowed to solidify and dry prior to inoculation.

- 5 Vials of each of the test organisms are maintained frozen in the vapor phase of a liquid nitrogen freezer. Test cultures are grown overnight at 35°C on the medium appropriate for the organism. Colonies are harvested with a sterile swab, and cell suspensions are prepared in Trypticase Soy broth (TSB) to equal the turbidity of a 0.5 McFarland standard. A 1:20 dilution of each suspension is made in
- 10 TSB. The plates containing the drug supplemented agar are inoculated with a 0.001 ml drop of the cell suspension using a Steers replicator, yielding approximately 10^4 to 10^5 cells per spot. The plates are incubated overnight at 35°C.

Following incubation the Minimum Inhibitory Concentration (MIC $\mu\text{g/ml}$), the lowest concentration of drug that inhibits visible growth of the organism, is read and

15 recorded. The data is shown in Tables I and II.

As shown in Scheme 1, the intermediates II for the compounds of this invention are also intermediates disclosed in the oxazolidinone patents and published applications hereinabove incorporated by reference. The intermediates IV for this invention are final products (Examples) from the oxazolidinone patents and published applications hereinabove incorporated by reference.

As shown in Scheme 1, Step 1, and illustrated in Example 5, the isothiocyanates III can be conveniently prepared by allowing the amine intermediates (II) to react with 1,1'-thiocarbonyldi-2(1H)-pyridone in solvents such as methylene chloride at 0 to 25°C. The thioureas (Ia, R' = H, alkyl₁₋₄) can then be prepared as shown in Step 2 by the reaction of III with ammonia or the appropriate primary amines in solvents such as 1,4-dioxane or tetrahydrofuran at 0-50°C. Alternatively, as illustrated in Example 6 and shown in Step 3, the thioureas can be prepared by allowing II to react with an appropriate isothiocyanate (R' - N = C = S) in solvents such as tetrahydrofuran at 0-50°C. Thioamides (Ib, R" = H, alkyl₁₋₄) are prepared by allowing II to react with an appropriate dithioester (R''' S-C(=S)-R''', Step 4 as illustrated in Example 4. This reaction is carried out in aqueous-alcoholic solvents at 0-50°C in the presence of an equivalent of an alkali metal hydroxide. This reaction, especially when R''' is methyl or ethyl, can be catalyzed by an alkali metal fluoride.

The reaction of II with R'''-S-C(S)-R''' (R'''=CH₃, C₂H₅) to give Ib (Step 4) can also be carried out in the presence of a tertiary amine base such as triethylamine in solvents such as THF, dioxane or methylene chloride at 10-50°C for 3-48 hr.

When the reaction conditions are tolerated by the substituents on R (see, for example, Examples 1-3) the thioamides (Ib, R" = H, alkyl₁₋₄) can also be conveniently prepared (Step 5) by allowing the appropriate amide intermediates (IV) to react with reagents such as 2,4-bis(p-methoxyphenyl)-1,3-dithiadiphosphetane-2,4-disulfide (Lawesson's Reagent) in 1,4-dioxane, benzene, toluene or tetrahydrofuran at 60-110°C; phosphorus decasulfide and sodium carbonate in tetrahydrofuran at 20-50°C [Brillon, D., *Synthetic Communications*, 20, 3085 (1990)] or phosphorus decasulfide and sodium fluoride in 1,2-dimethoxyethane at 20-50°C [Hartke, K., Gerber, H.-D., *J. Prakt. Chem.*, 338, 763 (1996)].

Compounds Ic are prepared (Step 6) by allowing II to react first with carbon disulfide and a tertiary amine base such as triethylamine in solvent mixtures containing water and methanol, ethanol or isopropanol at 10-50°C for 5-24 hours. The resulting intermediate is treated with an alkylating agent (R''' X where X represents bromo, iodo, alkylsulfonyloxy or arylsulfonyloxy) at 0-30°C to give

compounds Ic. In Step 7, compounds Ic are allowed to react with alkali metal alkoxide such as sodium methoxide or potassium ethoxide in the corresponding alkanol as solvent. This reaction is conveniently carried out at the reflux temperature of the alkanol for 1-24 hr.

Step 1: A mixture of (S)-(-)-N-[[3-[3-fluoro-4-(3,6-dihydro-2H-thiopyran-4-yl)phenyl]-2-oxo-5-oxazolidinyl]methyl]acetamide S-oxide (4.50 g, can be obtained
10 according to the procedures disclosed in International Publication No. WO 97/09328) and platinum oxide (697 mg) in methanol (164 mL) is shaken on the Parr apparatus under a hydrogen atmosphere at 40 psi for 18 hours. The resulting mixture was stirred at 0°C for 30 minutes and at ambient temperature for 1 hour and was then diluted with methylene chloride (40 mL), washed with water (25 mL) and brine (25 mL), dried over anhydrous sodium sulfate and concentrated *in vacuo*. The crude product was chromatographed on silica gel (70 - 230 mesh, 20 g), eluting with acetonitrile/methylene chloride (40/60), and those fractions with an $R_f = 0.07$ by TLC (acetonitrile/methylene chloride, 30/70) were pooled and concentrated to give (S)-cis-3-[3-Fluoro-4-(tetrahydro-1-oxido-2H-thiopyran-4-yl)phenyl]-5-isothiocyantomethyl-2-oxazolidinone, mp 187 - 190°C (dec.).

EXAMPLE 9 (S)-trans-N-[[3-[3-Fluoro-4-(tetrahydro-1-oxido-2H-thiopyran-4-yl)phenyl]-2-oxo-5-oxazolidinyl)methyl]ethanethioamide
 10

Step 1: (S)-(-)-N-[[3-[3-fluoro-4-(3,6-dihydro-2H-thiopyran-4-yl)phenyl]-2-oxo-5-ox azolidinyl)methyl]acetamide S-oxide (disclosed in International Publication No.
 20 WO 97/09328) may be reduced to the corresponding cis- and trans-sulfoxides by catalytic hydrogenation in the presence of a catalyst and solvent. Alternatively, the sulfide by product of this reduction reaction can be oxidized with an oxidizing agent such NaIO₄ or meta-chloroperoxybenzoic acid in solvent to provide the cis- and

Alternatively, the sulfide byproduct can be oxidized selectively to the trans isomer using t-butyl hydroperoxide and a catalyst such as Ti(OiPr)₄ and D-diisopropyl tartrate in a suitable solvent. The isomeric mixture can then be separated by chromatography to isolate the trans-sulfoxide, mp 211 - 212°C (dec.). A mixture of the trans-sulfoxide, (S)-trans-(-)-N-[[3-[3-fluoro-4-(tetrahydro-1-oxido-2H-thiopyran-4-yl)phenyl]-2-oxo-5-oxazolidinyl)methyl]acetamide, (0.90 g) and
 30 hydroxylamine hydrochloride (0.85 g) in pyridine (11.0 mL) and ethanol (1.2 mL) is stirred in a screw-cap vial at 100°C for 23 hrs and at ambient temperature for 19 hrs, during which additional hydroxylamine hydrochloride (340 mg) and pyridine (1 mL) is added. The reaction mixture is then concentrated under reduced pressure, diluted with saturated aqueous sodium carbonate (50 mL) and saline (50 mL) and

PREPARATION Z Methyl Dithiopropionate

- 5 A stirred mixture of magnesium turnings (12.6 g, 0.520 g atom) and THF (100 mL) under nitrogen is treated with a crystal of iodine and about 5% of a solution of bromoethane (30.0 mL, 0.40 mol) in THF (200 mL). When the reaction starts, the remainder of the bromoethane solution is added, dropwise at a rate sufficient to maintain a gentle reflux.
- 10 After the addition, stirring is continued for 1 hour; the resulting solution is cooled to -20 °C and treated, during 10 minutes with carbon disulfide (24.0 mL, 0.40 mol). The mixture is warmed to 15 °C, treated with methyl iodide (28.0 mL, 0.45 mol) and kept at 60 °C for 1 hour. It is then cooled in an ice bath, treated with ice and extracted with Et₂O. The extract is washed with brine, dried (MgSO₄) and concentrated. Distillation of the residue gives
- 15 34.0 g of the titled product, bp 48-52 °C (12 mmHg).

The following methyl dithio compounds were obtained when the appropriate alkyl magnesium bromide was substituted for ethyl magnesium bromide in the above procedure:

Step 1. Hexahydro-5-oxo-1,4-thiazepine is prepared according to the procedure described by Gallego (*J. Org. Chem.* 1993, 58, 3905-3911).

Step 2. Lithium aluminum hydride (5.5 mL of a 1M solution in THF) is added dropwise to a stirred solution of hexahydro-5-oxo-1,4-thiazepine (721.5 mg) in dry THF (21 mL) cooled to 0 °C. The reaction mixture is stirred at 0 °C for 10 min, then at room temperature for 4 h. The reaction mixture is quenched by careful successive addition of water (0.2 mL), 5 N aqueous NaOH (0.2 mL) and water (0.74 mL). The reaction mixture becomes very thick and gel-like. The reaction mixture is diluted with ether (50 mL) and filtered through a pad of celite. The filter cake is washed with ether (100 mL). The filtrate is concentrated to afford 616.6 mg of 1,4-hexahydrothiazepine which is used immediately in the next step.

Step 3. To a stirred solution of 1,4-hexahydrothiazepine (596.0 mg) and 3,4-difluoronitrobenzene (0.51 mL) in acetonitrile (14 mL) is added diisopropylethylamine (1.0 mL). The yellow solution is heated at reflux for 18 h, then cooled and concentrated. The residue is diluted with CH₂Cl₂ (100 mL) and washed with saturated aqueous NH₄Cl (35 mL). The phases are separated and the organics are dried (MgSO₄), filtered and concentrated. The residue is purified by flash chromatography using 20% EtOAc in hexane as the eluent to afford 830.2 mg of the nitrobenzene. Mp 115-116 °C. Anal. Calcd for C₁₁H₁₃FN₂O₂S: C, 51.55; H, 5.11; N, 10.93; S, 12.51. Found: C, 51.47; H, 5.12; N, 10.79; S, 12.42.

Step 4. To a stirred suspension of the nitrobenzene prepared in Step 3 (5.5 g) in EtOH (260 mL) is added a solution of 2 M aqueous CuSO₄ (11.9 mL). The mixture is cooled to 0 °C and NaBH₄ (4.1 g) is added in portions. The reaction mixture turns very

dark and is stirred at 0 °C for 10 min, at room temperature for 30 min, and then heated at reflux for 3 h. The cooled reaction mixture is diluted with EtOAc (500 ml) and washed with water (200 mL). The aqueous mixture is extracted with EtOAc (3 x 200 mL). The combined organics are dried (MgSO₄), filtered and concentrated to afford the aniline

5 intermediate.

Step 5. The dark residue from Step 4 is dissolved in 2:1 acetone/water (255 mL) and cooled to 0 °C. To this stirred mixture is added solid NaHCO₃ (5.4 g) followed by benzylchloroformate (7.7 mL). The reaction mixture is stirred at 0 °C for 10 min, then at room temperature for 24 h. The reaction mixture is quenched with 10% aqueous
10 NaHSO₄ (200 mL) and then poured into EtOAc (300 mL). The phases are separated and the aqueous phase is extracted with EtOAc (2 x 250 mL). The combined organics are dried (MgSO₄), filtered and concentrated. The residue is purified by MPLC using 20% EtOAc in hexane to afford 6.03 g of the benzylcarbamate as a yellow solid. mp 72-74 °C; Anal. Calcd for C₁₉H₂₁FN₂O₃S: C, 63.31; H, 5.87; N, 7.77; S, 8.89. Found: C,
15 63.31; H, 5.97; N, 7.69; S, 8.79.

Step 6. To a stirred solution of the carbamate from Step 5 (3.0 g) in dry THF (33 mL) under N₂ cooled to -78 °C, is added dropwise via syringe a 1.6 M solution of nBuLi in hexane (5.4 mL). The reaction mixture was stirred at -78 °C for 35 min, then R-glycidyl butyrate (1.2 mL) is added. The reaction mixture is stirred at -78 °C for 30 min,
20 then at room temperature overnight during which time a precipitate forms. The reaction mixture is quenched with saturated aqueous NH₄Cl (33 mL) and poured into EtOAc (100 mL). The phases are separated. The organic phase is washed with saturated aqueous NaHCO₃ (50 mL), brine (50 mL), dried (MgSO₄), filtered and concentrated. The residue is purified by flash chromatography using EtOAc as the eluent to afford 2.5
25 g of a hydroxymethyl oxazolidinone. Mp 100-102 °C. Anal. Calcd for C₁₅H₁₉FN₂O₃S: C, 55.20; H, 5.87; N, 8.58; S, 9.82. Found: C, 55.09; H, 5.91; N, 8.36; S, 9.57.

Step 7. To a stirred solution of the alcohol prepared in Step 6 (1.7 g) in CH₂Cl₂ (35 mL) cooled to 0 °C, is added triethylamine (1.1 mL) followed by methanesulfonyl chloride (0.5 mL). The reaction mixture is stirred at 0 °C for 10 min, then at room
30 temperature for 1 h. The reaction mixture is treated with water (35 mL). The phases are separated and the aqueous phase is extracted with CH₂Cl₂ (35 mL). The combined

organic phases are dried (MgSO_4), filtered and concentrated. The residue is purified by flash chromatography using 80% EtOAc in hexane as the eluent to afford 2.1 g of the mesylate. Mp 132-142 °C. Anal. Calcd for $\text{C}_{16}\text{H}_{21}\text{FN}_2\text{O}_5\text{S}_2$: C, 47.51; H, 5.23; N, 6.93; S, 15.85. Found: C, 47.18; H, 5.28; N, 6.84; S, 15.60.

5 Step 8. Ammonia gas is bubbled into a stirred suspension of the mesylate prepared in Step 7 (941.7 mg) in 1:1 THF/ CH_3OH (40 mL) until saturated (approx. 5 min). The reaction mixture is heated in a sealed tube at 100 °C for 72 h. The cooled reaction mixture is concentrated to give the crude amine, which is immediately suspended in CH_2Cl_2 (35 mL) and cooled to 0 °C. To this stirred suspension is added
10 triethylamine (0.97 mL, 6.9 mmol) followed by di-*tert*-butyl dicarbonate (759.5 mg, 3.5 mmol). The reaction mixture becomes homogeneous and is stirred at RT for 18 h. The reaction mixture is poured into CH_2Cl_2 (75 mL) and washed with H_2O (1 x 50 mL). The organic phase is dried (MgSO_4), filtered and concentrated.
